Frequently Asked Questions

What is the GSQIS Toolbox?

The GSQIS Toolbox is an ArcGIS Pro plugin (Python Toolbox) developed by Idox Geospatial. It provides geospatial analysis tools — starting with the **Layer Statistics** tool, which summarises the data in any feature layer and exports a readable report.

Which versions of ArcGIS Pro does the toolbox support?

The GSQIS Toolbox is supported on **ArcGIS Pro 3.0 and above** running on Windows 10 or Windows 11 (64-bit).

Do I need administrator rights to install the toolbox?

No. Extract the toolbox files to a folder you own (e.g., your Documents folder or a dedicated GIS tools folder). Avoid placing files in C:\Program Files\ or other protected directories.

Does the toolbox require an internet connection?

No. The toolbox works entirely offline after installation.

Do I need to install any additional Python packages?

No. The toolbox uses only **arcpy**, which is built into ArcGIS Pro. No extra Python libraries are required.

Can I use the toolbox with ArcGIS Desktop (ArcMap)?

No. The GSQIS Toolbox is designed specifically for **ArcGIS Pro 3.0+** and is not compatible with ArcGIS Desktop (ArcMap).

Will the toolbox modify my existing data?

No. The toolbox only reads your data to compute statistics. It never modifies source layers. The only output it creates is the text report file you specify.

Can I add the toolbox to multiple ArcGIS Pro projects?

Yes. You can add the same `GSQIS_Toolbox.pyt` file to as many ArcGIS Pro projects as you like by following the installation steps in each project.

What types of data does Layer Statistics support?

The Layer Statistics tool works with any **vector feature layer** — points, lines, or polygons — including shapefiles, file geodatabase feature classes, enterprise geodatabase layers, and in-memory layers.

What does the output report contain?

The output is a plain-text (.txt) file with two sections: (1) **LAYER SUMMARY** — name, coordinate system, geometry type, feature count, field count; and (2) **FIELD STATISTICS** — numeric fields yield count, min, max, mean, median, sum, and standard deviation; text/categorical fields yield count, empty count, unique values, and the most frequently occurring values.

Troubleshooting

Toolbox does not appear in the Catalog pane after adding it

- **Wrong file selected.** Make sure you selected `GSQIS_Toolbox.pyt` (not a folder or other file).
- **Catalog pane needs refreshing.** Right-click **Toolboxes** → **Refresh**.
- **Wrong project open.** Check that the correct project is currently active.

ERROR 000732: Input Features: Dataset does not exist or is not supported

- The selected layer is not a valid vector feature layer. Ensure you have loaded a vector layer (shapefile or feature class) into your map.

ERROR 000210: Cannot create output ...

- The output report file path is not writable.
- Try saving the output to a folder you own, such as `C:\Users\YourName\Documents\`.
- Avoid paths on read-only network drives.

ExecuteError: Failed to execute (LayerStatistics)

- Restart ArcGIS Pro and re-run the tool.
- Ensure the input layer is fully loaded (visible on the map with features).
- If the error persists, contact support with the full error text from the **Messages** panel.

Output report is empty or shows no field statistics

- The input layer may contain no features. Open the attribute table to check.
- If the layer has features but no attribute fields (other than geometry), only layer-level information will appear.

ArcGIS Pro is slow to run the analysis

- Performance depends on dataset size. Layers with millions of features may take several minutes.

- Test first with a smaller subset: right-click the layer → **Data** → **Export Features**.

Toolbox disappears after closing and reopening ArcGIS Pro

- Toolboxes added manually are saved to the current project (.aprx file). If you opened a different project, re-add the toolbox.
- To avoid this in future, save your project after adding the toolbox (**Ctrl+S**).

Yellow warning triangle next to the toolbox

- The .pyt file has been moved or deleted from its original location.
- Re-add the toolbox: right-click **Toolboxes** → **Add Toolbox** and browse to the current location of GSQIS_Toolbox.pyt.

Still Need Help?

If your issue is not listed above or you are unable to resolve it, please contact the Idox Geospatial support team:

Channel	Details
Email support	geo-customersupport@idoxgroup.com
SDK & documentation	https://sdk.idoxgeospatial.co.uk/

When emailing support, please include:

- Your full name and organisation
- Your ArcGIS Pro version (e.g., 3.2.0)
- Windows version (e.g., Windows 11 64-bit)
- A description of the problem
- Any error messages from the **Messages** panel in ArcGIS Pro

We aim to respond within one business day.
